

IT-M series help you to simplify, all in control

If you ask an electronic engineer, what is his biggest headache at work? There may be a vast majority of engineers who will tell you that you can't find anything. Yes, it's not a circuit oscillation that can't be solved, it's not that the experimental waveform is difficult to achieve, it's when testing comes to a head and you can't find any instrument or device to use.

Do not think that our engineers cannot tidy up. It is true that the instruments in the laboratory are mostly different in size and length. Without the aid of auxiliary equipment, it is difficult to stack multiple instruments, and with the cumbersome wiring between the instruments, the environment is naturally difficult to achieve neatness. If the instruments are all on the cabinet, it will need frequent disassembly for different tests, which undoubtedly increases the workload of engineers.

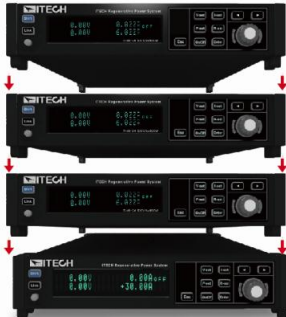

Based on the customer's industry requirements, in order to better help engineers solve this problem and achieve efficient and accurate work, ITECH has launched new IT-M series. IT-M series not only innovates in the technical aspects of the products, but also provides complete and innovative solutions from the perspective of industrial applications. The full range of products is with only 1/2U size, breaking through the shackles of traditional product design, with a patented design and side ventilation design. The flexible modular design makes it simple for IT-M3100 to stack

directly, no need to purchase any accessories. The open structure brings users with different free combinations, just like blocks stacking, simple and convenient.

IT-M series include five series of products, such as DC power supply, regenerative electronic load, AC power supply, bipolar power supply, and power system. The same design allows engineers to easily stack the entire test system together for maximum unity. It is also possible to easily load one or more IT-M series product into the cabinet space with an optional rack mount kit when customer test requirements increase, it can be said that the test requirements of customers under various test situations have been met to the maximum extent.

The first launch of IT-M3100 series ultra-compact wide range dc power supply break through the traditional shackles, only 1/2U in the ultra-compact size, not only can output high power, but also has high performance and multi-function at the same time. IT-M3100 series consists of 12 models, providing 6 voltages, and can be combined to achieve a variety of output power.

However, IT-M3100 series has flexible modular design with up to 16*16 independent multi-channels, and users can configure each channel according to the test requirements of DUT. IT-M3100 is fully satisfied customization requirements and with broad engineering practical value, suitable for various applications in fields such as R&D, design verification and Automatic test system and other applications.
